## 1. How to read this document

This guideline covers the use of an invoice in OIOUBL. The guideline must be read in correlation with the remaining documents included in the OIOUBL package.

### 1.1 Structure of this document

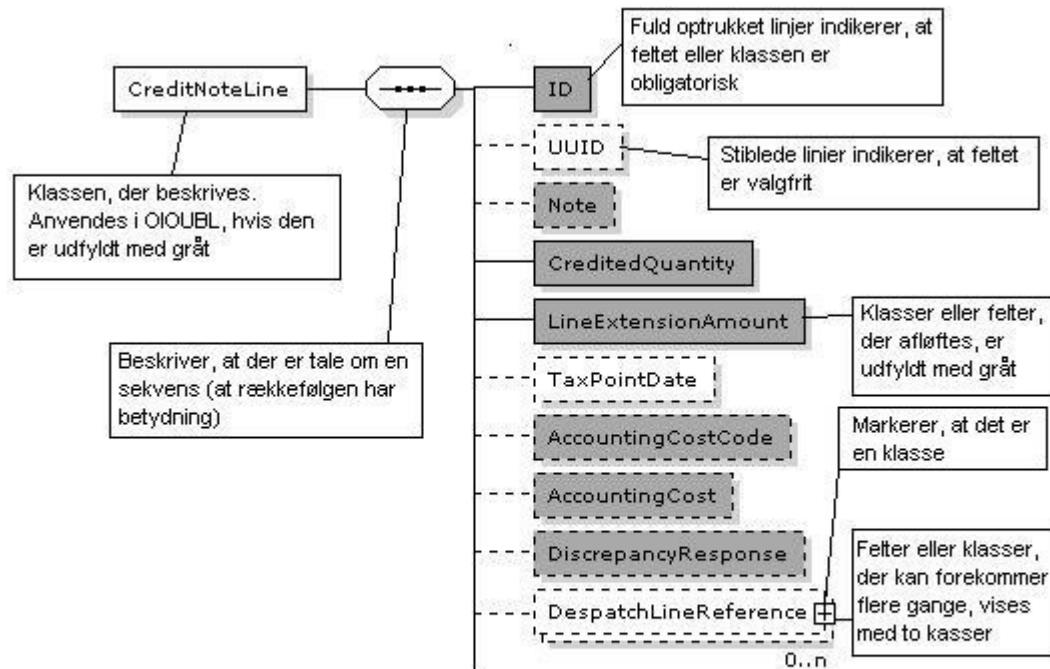

This document should be seen as the normative description of an invoice. In case of any conflict, the most specific description will always apply. For example, the description on the lines of a specific element takes precedence of the description at document level. Hence, the descriptions at document level are default values for the lines. The examples in this document and related common guidelines should be seen as descriptive. The guideline text takes precedence of the figures.

The document includes a reading instruction, a description of how to fill in document instances, as well as the actual class specification. The actual specification is composed of:

- A figure showing the class elements that are included in OIOUBL.
- A text specification of the class.
- A list of the UBL elements that from a business perspective make no sense in the specific context.
- A list of the fields that are included in the class.
- A list of the sub-classes that are included in the class.
- A table of key data such as definitions, names, references, and business rules for each of the class fields.
- A table of key data such as definitions, names, references, and business rules for the sub-classes of the class.
- For each of the sub-classes that is used differently than described in the class library, OIOUBL\_GUIDE\_LIBRARY (ref 30), a subsection contains a corresponding specification. Hence, the sub-classes that have been included in the specification are not selected based on relevance, but solely based on whether they deviate from the general definition of the library.

### 1.2 Figure definitions

In the class specifications, the class is shown as schema documentation.

### 1.3 Term definitions

In this specification, the following terms will be used in the tables:

<i>Term</i>	<i>Explanation</i>
UBL name	The name that is found in the UBL 2.0 schemas
DK-name	The name in Danish
Use	<p>Describes the cardinality, i.e. the rule describing how many instances of the business information entity are allowed:</p> <ul style="list-style-type: none"> <li>[1] specifies that one and only one instance is allowed.</li> <li>[0..1] means that the business information entity is optional.</li> <li>[0..n] means that null to infinity instances may occur.</li> <li>[1..n] means that no less than one instance to an infinite number of instances may occur.</li> </ul>
Alternative term	Specifies a term which is also used to describe the business information entity.
Used	Determines whether the receiver should be expected to be able to decode the described business information, if it is attached. Information that is not used may still, however, be used upon bilateral agreement.
Business rule	Describes the rules that are attached to the business information entity. Business rules are normative, and will be part of the validation of the document in question.
Recommended	Specifies that common practice requires the described business information entity to be attached. This is a

non-normative guide to the use of the business information entity.

Allowed values:	Describes the value set that the business information entity should conform with.
Codelist	Refers to the codelist that the value set should be found in.
Class	A structure of coherent business information.

## 2. How to fill in OIOUBL document instances

An Invoice must follow the related UBL schema, and conform to the rules of this guideline. The instances follow the W3C XML specifications, which means that, unless otherwise stated, the normal XML rules apply. It is therefore recommended that an xml encoder is used for reading the documents.

### 2.1 Namespace

A Namespace is a semantic space in which names are unique and attached to a specific interpretation.

Namespace often occur as libraries, and may be referenced via an alias-variable. The expression:

<... xmlns:cac="urn:oasis:names:specification:ubl:schema:xsd:CommonAggregateComponents-2" ...>

means that elements with the prefix "cac" (alias variable) belongs to the "...

CommonAggregateComponents-2" namespace. The namespace that is referenced by the actual document is indicated by "xmlns =...", i.e. without an alias variable. It is recommended to use the alias variables that are specified in UBL, but this is not a requirement. For an OIOUBL document instance to be validated the following namespaces must be specified:

Alias variable	Namespace
	urn:oasis:names:specification:ubl:schema:xsd:Invoice-2
cac	urn:oasis:names:specification:ubl:schema:xsd:CommonAggregateComponents-2
ccts	urn:oasis:names:specification:ubl:schema:xsd:CoreComponentParameters-2
cbc	urn:oasis:names:specification:ubl:schema:xsd:CommonBasicComponents-2
sdt	urn:oasis:names:specification:ubl:schema:xsd:SpecializedDatatypes-2
udt	urn:un:unece:uncefact:data:specification:UnqualifiedDataTypesSchemaModule:2
ext	urn:oasis:names:specification:ubl:schema:xsd:CommonExtensionComponents-2
xsi	http://www.w3.org/2001/XMLSchema-instance

### 2.2 Comments

Comments may be used in document instances to facilitate any manual processing of the document. This is particularly relevant during the introduction phase of new systems that use OIOUBL. For those who wish to formalize these comments, we recommend the Dublin-Core metadata definitions, see "

<http://dublincore.org/documents/dcmi-terms/> . The following terms are used in the examples of the scenario descriptions [S01-S07] :

DC-Term	Description	Example
Title	Describes the title of the document instance	BASPRO_01_01_00_Invoice_v2p0.xml
Replaces	Reference to the preceding instance	BASPRO_01_01_00_Invoice_v0p1.xml
Publisher	Describes who is responsible for the document instance.	"IT og Telestyrelsen"
Creator	Describes the person or the system that created the instance.	"OIOERP v 1.0.2 release 34"
Created	Date (and possibly time) of the creation of the document.	2006-09-08
Modified	Date (and possibly time) when the document was last modified.	2006-09-08
Issued	Date (and possibly time) when it was issued.	2006-09-08
ConformsTo	Description of the context that it belongs to.	OIOUBL_ScenarioPackage_BASPRO
Description	General description	"This document is produced as part of the OIOUBL Basic procurement scenario package"
Rights	Any copyrights that apply to the instance.	"It can be used following the Common Creative License"

Only use meta data that you consider applicable, and only enter valid data. From the above list we particularly recommend using the "Creator" term, as this may ease the troubleshooting at the receiver's system. Comments should be specified within the root element of the document.

## 2.3 Process instructions

Process instructions are instructions that are not covered by the OIOUBL standard, but which may be used for controlling other logics. For example, when specifying that an instance is used for test purposes. A process instruction is specified by "█ ◎ □ ◊ ◆ ◇ ◉ ◌ ◍" and may contain attributes as shown in the example below. Process instructions should be specified within the root element of the document.

```
<?TestInstance
  ResponseTo="smtp:test@company.dk"
  description= "apply your comment here"
?>
```

## 2.4 Relations to instances of other customizations

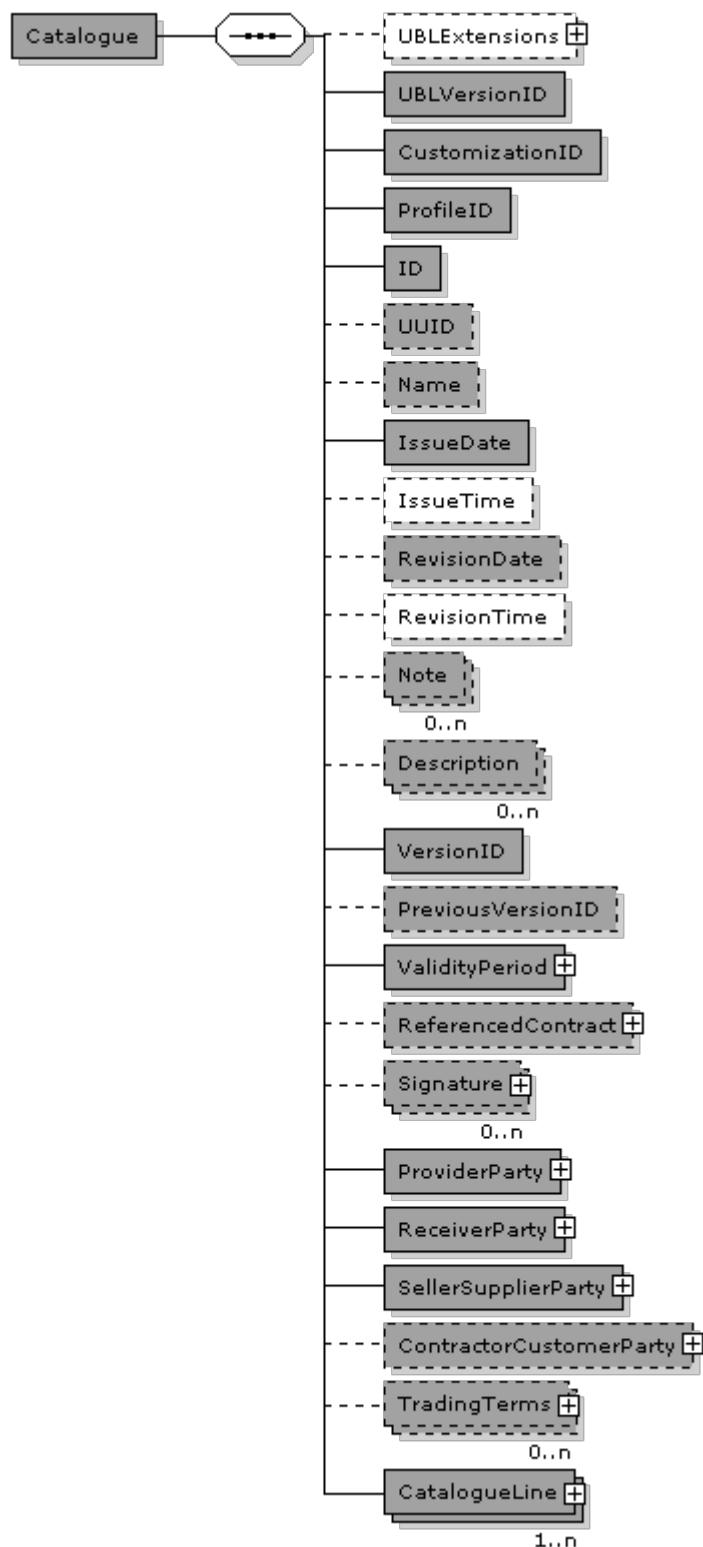

An instance is specified as being OIOUBL by entering "CustomizationID" as "OIOUBL-2.0". OIOUBL instances are built upon UBL 2.0, and may therefore be interpreted directly by UBL 2.0 readers. Instances from other UBL 2.0-customizations can be read directly by OIOUBL readers by changing the "CustomizationID", provided the instance conforms to the requirements of this guideline.

## 2.5 Code example

Code examples are available in the scenario descriptions [S01-S07]

### 3. Catalogue

### 3.1. Catalogue

## Catalogue specification

Name	Catalogue	Alternative term
<b>Definition</b>	<p>OIOUBL-2.0 Catalogue is a document for the creation and maintenance of electronic catalogues. The document is used for the creation of new catalogues as well as for additions, updates or deletions of items in existing catalogues.</p> <p>Five documents are used to implement and maintain catalogues. Catalogue can be used to create a new catalogue or update entire lines. A catalogue can be exchanged between a supplier and a customer, between a supplier and a third party, for example a purchase portal, between a third party and a customer or between two third parties. As a result it is possible to specify the identity of the customer and the supplier in both document and line level.</p> <p>The Catalogue Request document is used to specify which types of catalogues the supplier requests, for example a new catalogue or an update, and also which products are requested. As described, the Catalogue document can be used for creating and adding, updating or deleting items in existing catalogues. The Catalogue Item Specification Update document can be used when only the item specification needs to be updated in an existing catalogue. The Catalogue Deletion document deletes an entire catalogue. Catalogue documents differs from other document types in that sender and receiver can be third parties. For example, the receiver can be an electronic marketplace in stead of the customer himself.</p> <p>But the catalogue documents must also be viewed in relation to the entire purchasing process running from sourcing, ordering and invoicing to payment and the other OIOUBL 2.0 documents used for these purposes. Implementation of a catalogue can be the first step in the purchasing process followed by an order and an invoice.</p> <p>The apparent advantages of the OIOUBL 2.0 documents is the standardization of business documents for different purposes. The UBL 2.0 standard is a flexible standard that supports most of the business needs. Because it also is an international standard the document can be used across national boundaries. The Danish version is named OIOUBL 2.0 and is designed to meet Danish needs and demands.</p> <p>The advantage of OIOUBL-2.0 is the possibility of designing fully automated purchasing flows in which the electronic documents can be validated and matched automatically, thereby saving resources compared to manual processing.</p>
